

## Given a sequence of words, print all anagrams together

### | Set 1

Given an array of words, print all anagrams together. For example, if the given array is {"cat", "dog", "tac", "god", "act"}, then output may be "cat tac act dog god".

A **simple method** is to create a Hash Table. Calculate the hash value of each word in such a way that all anagrams have the same hash value. Populate the Hash Table with these hash values. Finally, print those words together with same hash values. A simple hashing mechanism can be modulo sum of all characters. With modulo sum, two non-anagram words may have same hash value. This can be handled by matching individual characters.

Following is **another method** to print all anagrams together. Take two auxiliary arrays, index array and word array. Populate the word array with the given sequence of words. Sort each individual word of the word array. Finally, sort the word array and keep track of the corresponding indices. After sorting, all the anagrams cluster together. Use the index array to print the strings from the original array of strings.

Let us understand the steps with following input Sequence of Words:

```
"cat", "dog", "tac", "god", "act"
```

1) Create two auxiliary arrays index[] and words[]. Copy all given words to words[] and store the original indexes in index[]

```
index[]:  0   1   2   3   4
words[]: cat dog tac god act
```

2) Sort individual words in words[]. Index array doesn't change.

[Recursion](#)

[Geometric Algorithms](#)

```
index[]:  0    1    2    3    4
words[]:  act  dgo  act  dgo  act
```

3) Sort the words array. Compare individual words using strcmp() to sort

```
index:     0    2    4    1    3
words[]:  act  act  act  dgo  dgo
```

4) All anagrams come together. But words are changed in words array. To print the original words, take index from the index array and use it in the original array. We get

```
"cat tac act dog god"
```

Following is C implementation of the above algorithm. In the following program, an array of structure "Word" is used to store both index and word arrays. DupArray is another structure that stores array of structure "Word".

```
// A program to print all anagrams together
#include <stdio.h>
#include <stdlib.h>
#include <string.h>

// structure for each word of duplicate array
struct Word
{
    char* str; // to store word itself
    int index; // index of the word in the original array
};

// structure to represent duplicate array.
struct DupArray
{
    struct Word* array; // Array of words
    int size; // Size of array
};

// Create a DupArray object that contains an array of Words
struct DupArray* createDupArray(char* str[], int size)
{
    // Allocate memory for dupArray and all members of it
    struct DupArray* dupArray =
        (struct DupArray*) malloc( sizeof(struct DupArray) );
    dupArray->size = size;
    dupArray->array =

```

for (i = 0; i < size; ++i)
    printf("%s ", wordArr[dupArray->array[i].index]);
}

```

```

// Driver program to test above functions
int main()
{
    char* wordArr[] = {"cat", "dog", "tac", "god", "act"};
    int size = sizeof(wordArr) / sizeof(wordArr[0]);
    printAnagramsTogether(wordArr, size);
    return 0;
}

```

Output:

```
act tac cat god dog
```

**Time Complexity:** Let there be N words and each word has maximum M characters. The upper bound is  $O(NM \log M + MN \log N)$ .

Step 2 takes  $O(NM \log M)$  time. Sorting a word takes maximum  $O(M \log M)$  time. So sorting N words takes  $O(NM \log M)$  time. step 3 takes  $O(MN \log N)$  Sorting array of words takes  $N \log N$  comparisons. A comparison may take maximum  $O(M)$  time. So time to sort array of words will be  $O(MN \log N)$ .

We will soon be publishing more efficient methods to solve this problem. Please write comments if you find anything incorrect, or you want to share more information about the topic discussed above.

```
import java.util.*;
```

```
public class PrintAllAnagramsTogether {  
    public HashMap<string,arraylist<string>> words = new HashMap<string, array
```

```
    public void seqWords(String[] arr) {  
        for(String word: arr) {  
            char[] c = word.toCharArray();  
            Arrays.sort(c);  
            String Sortedword = new String(c);  
            if(words.containsKey(Sortedword)) {  
                words.get(Sortedword).add(word);  
            }  
            else {  
                ArrayList<string> ar = new ArrayList<string>();  
                ar.add(word);  
                words.put(Sortedword, ar);  
            }  
        }  
    }  
}
```

You can sort a word of characters in  $O(M)$  time using counting sort (instead of  $O(NM + MN\log N)$ )

2 ^ | v · Reply · Share ›

**Sumit Monga** · 7 months ago

Another solution using CountSort and then RadixSort to sort the individual cha

```
#include<stdio.h>
```

```
#include<string.h>
```

```
#include<iostream>
```

```
#include<stdlib.h>
```

```
using namespace std;
```

```
#define RANGE 255
```

```
typedef struct Word
```

```
{
```

```
char * str;
```

```
int ind:
```

**gargsanjay** • 10 months ago

array is a pointer to word struct still we are using array[i].word  
isn't this wrong??

```
/* Paste your code here (You may delete these lines if not writing c
```

**pritybhudolia** • 11 months ago

The idea that I have used here is similar to method 1.The sum of each letter in  
have same sumvalue.

```
/*
#include<stdio.h>
#include<conio.h>
void printAnagramsTogether(char* wordArr[], int size)
{
    int i=0,j=0,k=0,temp,index;
    int sum[10][10]={0};
    //here sum is a 2d array that contains the letter in each word at
    for(i=0;i<size;i++)
    {
        for(j=0;wordArr[i][j]!='&#92;&#48';j++)
        {
            sum[k][0]=sum[k][0]+(int)word,
```

^ | v • Reply • Share ›

**Amit Agnihotri** → pritybhudolia • 8 months ago

not necessarily

ex: "aabc" and "bbc" will have same sum.

similary "abc" and "aad".....

**atul** • 2 years ago

another approach:-

1) sort the input

2) insert sorted input in trie

3) "at the end of word" node of trie..maintain linked list which contain actual wc

4) if already present then append to the linked list maintained.

```
/* Paste your code here (You may delete these lines if not writing c
```
