

Print a Binary Tree in Vertical Order | Set 1

Given a binary tree, print it vertically. The following example illustrates vertical order traversal.

The output of print this tree vertically will be:

```

4
2
1 5 6
3 8
7
9
    
```

We strongly recommend to minimize the browser and try this yourself first.

The idea is to traverse the tree once and get the minimum and maximum horizontal distance with respect to root. For the tree shown above, minimum distance is -2 (for node with value 4) and maximum distance is 3 (For node with value 9).

Once we have maximum and minimum distances from root, we iterate for each vertical line at distance minimum to maximum from root, and for each vertical line traverse the tree and print the

nodes which lie on that vertical line.

Algorithm:

```
// min --> Minimum horizontal distance from root
// max --> Maximum horizontal distance from root
// hd --> Horizontal distance of current node from root
```

```
findMinMax(tree, min, max, hd)
```

```
    if tree is NULL then return;
```

```
    if hd is less than min then
```

```
        min = hd;
```

```
    else if hd is greater than max then
```

```
        *max = hd;
```

```
    findMinMax(tree->left, min, max, hd-1);
```

```
    findMinMax(tree->right, min, max, hd+1);
```

```
printVerticalLine(tree, line_no, hd)
```

```
    if tree is NULL then return;
```

```
    if hd is equal to line_no, then
```

```
        print(tree->data);
```

```
    printVerticalLine(tree->left, line_no, hd-1);
```

```
    printVerticalLine(tree->right, line_no, hd+1);
```

Implementation:

Following is C++ implementation of above algorithm.

```
#include <iostream>
using namespace std;

// A node of binary tree
struct Node
{
    int data;
    struct Node *left, *right;
```

{
    // Base case
    if (node == NULL) return;

    // Update min and max
    if (hd < *min) *min = hd;
    else if (hd > *max) *max = hd;

    // Recur for left and right subtrees
    findMinMax(node->left, min, max, hd-1);
    findMinMax(node->right, min, max, hd+1);
}

// A utility function to print all nodes on a given line_no.
// hd is horizontal distance of current node with respect to root.
void printVerticalLine(Node *node, int line_no, int hd)
{
    // Base case
    if (node == NULL) return;

    // If this node is on the given line number
    if (hd == line_no)
        cout << node->data << " ";

    // Recur for left and right subtrees
    printVerticalLine(node->left, line_no, hd-1);
    printVerticalLine(node->right, line_no, hd+1);
}

// The main function that prints a given binary tree in
// vertical order
void verticalOrder(Node *root)
{

```

```
// Find min and max distances with respect to root
int min = 0, max = 0;
findMinMax(root, &min, &max, 0);

// Iterate through all possible vertical lines starting
// from the leftmost line and print nodes line by line
for (int line_no = min; line_no <= max; line_no++)
{
    printVerticalLine(root, line_no, 0);
    cout << endl;
}
}
```

```
// Driver program to test above functions
int main()
{
    // Create binary tree shown in above figure
    Node *root = newNode(1);
    root->left = newNode(2);
    root->right = newNode(3);
    root->left->left = newNode(4);
    root->left->right = newNode(5);
    root->right->left = newNode(6);
    root->right->right = newNode(7);
    root->right->left->right = newNode(8);
    root->right->right->right = newNode(9);

    cout << "Vertical order traversal is \n";
    verticalOrder(root);

    return 0;
}
```

Output:

Vertical order traversal is

```
4
2
1 5 6
3 8
7
9
```

Time Complexity: Time complexity of above algorithm is $O(w*n)$ where w is width of Binary Tree

and n is number of nodes in Binary Tree. In worst case, the value of w can be $O(n)$ (consider a complete tree for example) and time complexity can become $O(n^2)$.

This problem can be solved more efficiently using the technique discussed in [this](#) post. We will soon be discussing complete algorithm and implementation of more efficient method.

Java Implementation for the same can be find below :

```
public void findMinimumDistance(Node root, int minDistance,HashMap<int>
```

```
LinkedList<integer> temp = null;
```

```
if(root != null)
```

```
{
```

```
    findMinimumDistance(root.leftChild,minDistance-1,hm);
```

```
    //root.minDistance = minDistance++;
```

```
    findMinimumDistance(root.rightChild,minDistance+1,hm);
```

```
    if(hm.get(minDistance) != null)
```

```
{
```

```
        temp = hm.get(minDistance);
```

```
}
```

```
else
```

```
{
```

newbie · 16 days ago

add root->left->right->right= newNode(11);

it will produce wrong results as the case when there are more elements in right sub tree is not taken care of here.

An O(n) solution [Space complexity = Time complexity = O(n)] :

(Language: C++)

Complete Program: <http://ideone.com/sGMGGk>

```
// Global variables "mapped", "mini" and "maxi"
map<int, int> mapped;
int mini, maxi;

void vertical(struct node *root, int dist, vector<int> ans[]) {
    if(root == NULL)
        return;

    mini = min(mini, dist);
    maxi = max(maxi, dist);

    int index = mapped[dist];
```

if we use a hashmap with key as distance and value as linked list having node restrict it to $O(n)$ time complexity but with space complexity increased.
