

## Red-Black Tree | Set 2 (Insert)

In the [previous post](#), we discussed introduction to Red-Black Trees. In this post, insertion is discussed.

In [AVL tree insertion](#), we used rotation as a tool to do balancing after insertion caused imbalance. In Red-Black tree, we use two tools to do balancing.

- 1) Recoloring
- 2) [Rotation](#)

We try recoloring first, if recoloring doesn't work, then we go for rotation. Following is detailed algorithm. The algorithms has mainly two cases depending upon the color of uncle. If uncle is red, we do recoloring. If uncle is black, we do rotations and/or recoloring.

Color of a NULL node is considered as BLACK.

Let x be the newly inserted node.

- 1) Perform [standard BST insertion](#) and make the color of newly inserted nodes as RED.
- 2) Do following if color of x's parent is not BLACK or x is not root.
  - ....a) If x's uncle is **RED** (Grand parent must have been black from [property 4](#))
    - .....(i) Change color of parent and uncle as BLACK.
    - .....(ii) color of grand parent as RED.
    - .....(iii) Change x = x's grandparent, repeat steps 2 and 3 for new x.

## Uncle Red

....b) If x's uncle is **BLACK**, then there can be four configurations for x, x's parent (p) and x's grandparent (g) (This is similar to **AVL Tree**)

.....i) Left Left Case (p is left child of g and x is left child of p)

.....ii) Left Right Case (p is left child of g and x is right child of p)

.....iii) Right Right Case (Mirror of case a)

.....iv) Right Left Case (Mirror of case c)

3) If x is root, change color of x as BLACK (Black height of complete tree increases by 1).

Following are operations to be performed in four subcases when uncle is BLACK.

## All four cases when Uncle is BLACK

Left Left Case (See g, p and x)

Left Right Case (See g, p and x)

### Uncle Black and Left Right Case

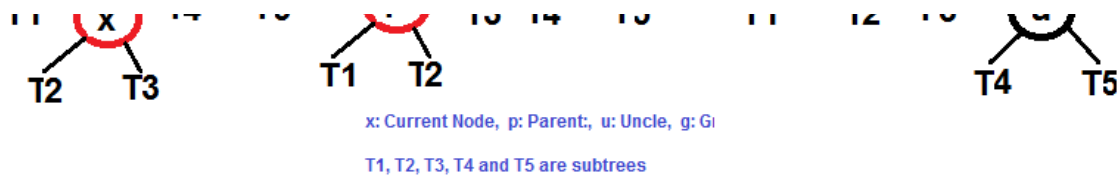

Intersection point of two Linked Lists

Lowest Common Ancestor in a BST.

Check if a binary tree is BST or not

Sorted Linked List to Balanced BST

Right Right Case (See g, p and x)

Uncle Black and Right Right Case  
(Mirror of Left Left Case)

x: Current Node, p: Parent, u: Uncle, g: Grandparent

T1, T2, T3, T4 and T5 are subtrees

Right Left Case (See g, p and x)

Uncle Black and Right Left Case  
(Mirror of Left Right Case)

x: Current Node, p: Parent, u: Uncle, g: Grandparent

T1, T2, T3, T4 and T5 are subtrees

Examples of Insertion

## Insert 10, 20, 30 and 15 in an empty tree

I ran RedBlackTreeViewer.java; mentioned below. But code is not correct. When I ran 4,7,17; it showed a tree with 4 as root and 12 as left node !! that is wrong. So I

You can take complete Java code. Take java classes from here. As they are in

**Anuj** · 2 months ago

First time ever, I understood insertion in red-black tree. Thanks.
