

How are parameters passed in Java?

In Java, parameters are always passed by value. For example, following program prints i = 10, j = 20.

```
// Test.java
class Test {
    // swap() doesn't swap i and j
    public static void swap(Integer i, Integer j) {
        Integer temp = new Integer(i);
        i = j;
        j = temp;
    }
    public static void main(String[] args) {
        Integer i = new Integer(10);
        Integer j = new Integer(20);
        swap(i, j);
        System.out.println("i = " + i + ", j = " + j);
    }
}
```

It is something confusing.

Please check this <http://stackoverflow.com/quest...>

It describes this issue with good examples :)

Java always passes the references by value. However, you can swap two strings. The following code is via arrays.

```
/* public static void main(String[] args) {  
    String a[] = {"hello", "world"};  
    swap(a);  
    System.out.println(a[0] + " " + a[1]);  
}  
  
static void swap(String[] a) {  
    String t = a[0];  
    a[0] = a[1];  
    a[1] = t;  
}  
} */
```

all wrapper classes are immutable so you can not swap using wrapper

In JAVA, parameters are passed by value. So, when we pass an object in JAVA, it is referred by the name of the object. Now, if we create the wrapper class and modify the variable through the object, it will change the value at the address (as parameter) which is demonstrated by the example above using wrapper class. However, in the first code, passing Integer object passes the object's address space...just local the variable pointing to the address are swapped and not the control returns back, it finds the same values there as before.

Guess **this** ll do

```
class Test {
    // swap() doesn't swap i and j
    public static void swap(Integer i, Integer j) {
        Integer temp = new Integer(i);
        i = j;
```

So how do we swap integers in java?

^ | v • Reply • Share ›

Shekhu → karan • 4 years ago

We can have a wrapper class over int to swap.

```

[sourcecode language="java"]class intWrap {
    int x;
}

```

```

public class Main {

```

```

    public static void main(String[] args) {

```

▶ [Java Wrapper](#)

▶ [Java Var Args](#)

▶ [Test Java Code](#)

```
intWrap i = new intWrap();  
i.x = 10;  
intWrap j = new intWrap();  
j.x = 20;  
swap(i, j);  
System.out.println("i.x = " + i.x + ", j.x = " + j.x);  
}
```

```
public static void swap(intWrap i, intWrap j) {  
    int temp = i.x;  
    i.x = j.x;  
    j.x = temp;  
}
```

Ajinkya Jadhav ➔ Shekhu • 2 years ago

Thanks. really helpful.

Now i know why wrappers are given so much credit in Java
