## Checked vs Unchecked Exceptions in Java

In Java, there two types of exceptions:

**1) Checked:** are the exceptions that are checked at compile time. If some code within a method throws a checked exception, then the method must either handle the exception or it must specify the exception using *throws* keyword.

For example, consider the following Java program that opens file at locatiobn "C:\test\a.txt" and prints first three lines of it. The program doesn't compile, because the function main() uses FileReader() and FileReader() throws a checked exception *FileNotFoundException*. It also uses readLine() and close() methods, and these methods also throw checked exception *IOException*

```
import java.io.*;

class Main {
    public static void main(String[] args) {
        FileReader file = new FileReader("C:\\test\\a.txt");
        BufferedReader fileInput = new BufferedReader(file);

        // Print first 3 lines of file "C:\test\a.txt"
        for (int counter = 0; counter < 3; counter++)
            System.out.println(fileInput.readLine());

        fileInput.close();
    }
}
```

Output:

Exception in thread "main" java.lang.RuntimeException: Uncompilable source code - unreported exception java.io.FileNotFoundException; must be caught or declared to be

```
thrown
```

```
at Main.main(Main.java:5)
```

To fix the above program, we either need to specify list of exceptions using throws, or we need to use try-catch block. We have used throws in the below program. Since *FileNotFoundException* is a subclass of *IOException*, we can just specify *IOException* in the throws list and make the above program compiler-error-free.

```
import java.io.*;

class Main {
    public static void main(String[] args) throws IOException {
        FileReader file = new FileReader("C:\\test\\a.txt");
        BufferedReader fileInput = new BufferedReader(file);

        // Print first 3 lines of file "C:\\test\\a.txt"
        for (int counter = 0; counter < 3; counter++)
            System.out.println(fileInput.readLine());

        fileInput.close();
    }
}
```

Output: First three lines of file "C:\\test\\a.txt"

**2) Unchecked** are the exceptions that are not checked at compiled time. In C++, all exceptions are unchecked, so it is not forced by the compiler to either handle or specify the exception. It is up to the programmers to be civilized, and specify or catch the exceptions.

In Java exceptions under *Error* and *RuntimeException* classes are unchecked exceptions, everything else under throwable is checked.

unchecked

checked

unchecked

Consider the following Java program. It compiles fine, but it throws *ArithmeticException* when run. The compiler allows it to compile, because *ArithmeticException* is an unchecked exception.

```
class Main {
    public static void main(String args[]) {
        int x = 0;
        int y = 10;
        int z = y/x;
    }
}
```

Output:

```
Exception in thread "main" java.lang.ArithmeticException: / by zero
    at Main.main(Main.java:5)
Java Result: 1
```

## Why two types?

See [Unchecked Exceptions — The Controversy](#) for details.

## Should we make our exceptions checked or unchecked?

Following is the bottom line from [Java documents](#)

*If a client can reasonably be expected to recover from an exception, make it a checked exception. If a client cannot do anything to recover from the exception, make it an unchecked exception*

**Vinay Singh** → Sean Collier • 2 months ago

Can you elaborate or share some code snippet. Usually "unhandled exception handling (throws or try-catch block) a checked exception.

so how compiler decide it is checked or unchecked...

^ | v • Reply • Share ›

**Vinay Singh** → rishav • 2 months ago

All exceptions are classes, derived from one of the classes in the Exception hierarchy (please notice that there are lines below the above mentioned classes below Exception and RuntimeException, the number of derived classes is not feasible to include them in the diagram).

Exception classes derived from RuntimeException class or any class derived from RuntimeException are "unchecked" and the others are "checked".

If you browse the Java documentation for any exception class, you will

where it's derived is mentioned at the top of the page, if you find java.lang hierarchy then it's unchecked else it's checked.

If the compiler is able to find out the problem at the time of compilation the program.. It reports that first U have to handle the Exception... so o whether it's checked or Unchecked

Nice

1 ^ | v • Reply • Share ›

**Abhishek** • 6 months ago

Why would the first program throw a FileNotFoundException. Is it assumed to be in the current location?

12 ^ | v • Reply • Share ›

**JavaUser** → Abhishek • 3 months ago

Because at the time of compilation only, the JVM comes to know that it is compiling the code and giving the Exception :)

**Ravi** · 7 months ago

Please do correct spelling mistake..

Should we make our exceptions checked or checked?

Here it should be checked or unchecked.
