Compute modulus division by a power-of-2-number

Compute n modulo d without division(/) and modulo(%) operators, where d is a power of 2 number.

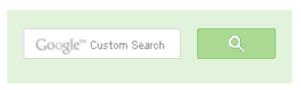

Let *i*th bit from right is set in d. For getting n modulus d, we just need to return 0 to *i*-1 (from right) bits of n as they are and other bits as 0.

For example if n = 6 (00..110) and d = 4(00..100). Last set bit in d is at position 3 (from right side). So we need to return last two bits of n as they are and other bits as 0, i.e., 00..010.

Now doing it is so easy, guess it....

Yes, you have guessing it right. See the below program.

```
#include<stdio.h>
/* This function will return n % d.
   d must be one of: 1, 2, 4, 8, 16, 32, ... */
unsigned int getModulo(unsigned int n, unsigned int d)
  return ( n & (d-1) );
/* Driver program to test above function */
int main()
  unsigned int n = 6;
  unsigned int d = 4; /*d must be a power of 2*/
  printf("%u moduo %u is %u", n, d, getModulo(n, d));
  getchar();
  return 0;
```

I was trying to find division and modulus of two positive numbers without / and

Here is the code.

Let me know it this doesn't work for any ALLOWED value.

```
#include <stdio.h>
int main(){
        int x = 238; // +ve value
        int y = 16; // +ve value
        int rem = x; // x%y
        int tmp = y;
        int div = 0; // x/y
        int tmp2 = 1;
         + f / \ / - - 0 \ C
```
