Function to check if a singly linked list is palindrome

Given a singly linked list of characters, write a function that returns true if the given list is palindrome, else false.

METHOD 1 (Use a Stack)
A simple solution is to use a stack of list nodes. This mainly involves three steps.
1) Traverse the given list from head to tail and push every visited node to stack.
2) Traverse the list again. For every visited node, pop a node from stack and compare data of popped node with currently visited node.
3) If all nodes matched, then return true, else false.

Time complexity of above method is O(n), but it requires O(n) extra space. Following methods solve this with constant extra space.

METHOD 2 (By reversing the list)
This method takes O(n) time and O(1) extra space.
1) Get the middle of the linked list.

2) Reverse the second half of the linked list.

3) Check if the first half and second half are identical.

4) Construct the original linked list by reversing the second half again and attaching it back to the first half

To divide the list in two halves, method 2 of this post is used.

When number of nodes are even, the first and second half contain exactly half nodes. The challenging thing in this method is to handle the case when number of nodes are odd. We don't want the middle node as part of any of the lists as we are going to compare them for equality. For odd case, we use a separate variable 'midnode'.

```c
/* Program to check if a linked list is palindrome */
#include<stdio.h>
#include<stdlib.h>
#include<stdbool.h>

/* Link list node */
struct node
{
    char data;
    struct node* next;
};

void reverse(struct node**);
bool compareLists(struct node*, struct node *);

/* Function to check if given linked list is
  palindrome or not */
bool isPalindrome(struct node *head)
{
    struct node *slow_ptr = head, *fast_ptr = head;
    struct node *second_half, *prev_of_slow_ptr = head;
    struct node *midnode = NULL;  // To handle odd size list
    bool res = true; // initialize result

    if (head!=NULL)
    {
        /* Get the middle of the list. Move slow_ptr by 1
          and fast_ptrr by 2, slow_ptr will have the middle
          node */
        while (fast_ptr != NULL && fast_ptr->next != NULL)
        {
            fast_ptr = fast_ptr->next->next;
```

```c
            /*We need previous of the slow_ptr for
             linked lists  with odd elements */
            prev_of_slow_ptr = slow_ptr;
            slow_ptr = slow_ptr->next;
        }

        /* fast_ptr would become NULL when there are even elements in
           And not NULL for odd elements. We need to skip the middle n
           for odd case and store it somewhere so that we can restore
           original list*/
        if (fast_ptr != NULL)
        {
            midnode = slow_ptr;
            slow_ptr = slow_ptr->next;
        }

        // Now reverse the second half and compare it with first half
        second_half = slow_ptr;
        prev_of_slow_ptr->next = NULL; // NULL terminate first half
        reverse(&second_half);  // Reverse the second half
        res = compareLists(head, second_half); // compare

        /* Construct the original list back */
         reverse(&second_half); // Reverse the second half again
         if (midnode != NULL)  // If there was a mid node (odd size ca
                               // was not part of either first half or

         {
            prev_of_slow_ptr->next = midnode;
            midnode->next = second_half;
         }
         else  prev_of_slow_ptr->next = second_half;
    }
    return res;
}

/* Function to reverse the linked list  Note that this
    function may change the head */
void reverse(struct node** head_ref)
{
    struct node* prev   = NULL;
    struct node* current = *head_ref;
    struct node* next;
    while (current != NULL)
    {
        next  = current->next;
        current->next = prev;
```

```c
            prev = current;
            current = next;
        }
        *head_ref = prev;
}

/* Function to check if two input lists have same data*/
bool compareLists(struct node* head1, struct node *head2)
{
        struct node* temp1 = head1;
        struct node* temp2 = head2;

        while (temp1 && temp2)
        {
            if (temp1->data == temp2->data)
            {
                temp1 = temp1->next;
                temp2 = temp2->next;
            }
            else return 0;
        }

        /* Both are empty reurn 1*/
        if (temp1 == NULL && temp2 == NULL)
            return 1;

        /* Will reach here when one is NULL
          and other is not */
        return 0;
}

/* Push a node to linked list. Note that this function
  changes the head */
void push(struct node** head_ref, char new_data)
{
        /* allocate node */
        struct node* new_node =
            (struct node*) malloc(sizeof(struct node));

        /* put in the data  */
        new_node->data  = new_data;

        /* link the old list off the new node */
        new_node->next = (*head_ref);

        /* move the head to pochar to the new node */
        (*head_ref)    = new_node;
```

```c
}

// A utility function to print a given linked list
void printList(struct node *ptr)
{
    while (ptr != NULL)
    {
        printf("%c->", ptr->data);
        ptr = ptr->next;
    }
    printf("NULL\n");
}

/* Drier program to test above function*/
int main()
{
    /* Start with the empty list */
    struct node* head = NULL;
    char str[] = "abacaba";
    int i;

    for (i = 0; str[i] != '\0'; i++)
    {
        push(&head, str[i]);
        printList(head);
        isPalindrome(head)? printf("Is Palindrome\n\n"):
                            printf("Not Palindrome\n\n");
    }

    return 0;
}
```

Output:

```
a->NULL
Not Palindrome

b->a->NULL
Not Palindrome

a->b->a->NULL
Is Palindrome
```

```
c->a->b->a->NULL
Not Palindrome

a->c->a->b->a->NULL
Not Palindrome

b->a->c->a->b->a->NULL
Not Palindrome

a->b->a->c->a->b->a->NULL
Is Palindrome
```

Time Complexity O(n)
Auxiliary Space: O(1)

METHOD 3 (Using Recursion)
Use two pointers left and right. Move right and left using recursion and check for following in each
recursive call.
1) Sub-list is palindrome.
2) Value at current left and right are matching.

If both above conditions are true then return true.

The idea is to use function call stack as container. Recursively traverse till the end of list. When
we return from last NULL, we will be at last node. The last node to be compared with first node of
list.

In order to access first node of list, we need list head to be available in the last call of recursion.
Hence we pass head also to the recursive function. If they both match we need to compare (2, n-
2) nodes. Again when recursion falls back to (n-2)nd node, we need reference to 2nd node from
head. We advance the head pointer in previous call, to refer to next node in the list.

However, the trick in identifying double pointer. Passing single pointer is as good as pass-by-
value, and we will pass the same pointer again and again. We need to pass the address of head
pointer for reflecting the changes in parent recursive calls.

Thanks to Sharad Chandra for suggesting this approach.

```c
// Recursive program to check if a given linked list is palindrome
#include <stdio.h>
#include <stdlib.h>
#include <stdbool.h>

/* Link list node */
struct node
{
    char data;
    struct node* next;
};

// Initial parameters to this function are &head and head
bool isPalindromeUtil(struct node **left, struct  node *right)
{
   /* stop recursion when right becomes NULL */
   if (right == NULL)
      return true;

   /* If sub-list is not palindrome then no need to
       check for current left and right, return false */
   bool isp = isPalindromeUtil(left, right->next);
   if (isp == false)
      return false;

   /* Check values at current left and right */
   bool isp1 = (right->data == (*left)->data);

   /* Move left to next node */
   *left = (*left)->next;

   return isp1;
}

// A wrapper over isPalindromeUtil()
bool isPalindrome(struct node *head)
{
   isPalindromeUtil(&head, head);
}

/* Push a node to linked list. Note that this function
   changes the head */
void push(struct node** head_ref, char new_data)
{
    /* allocate node */
```

Are you a developer? Try out the HTML to PDF API

```c
    struct node* new_node =
            (struct node*) malloc(sizeof(struct node));

    /* put in the data  */
    new_node->data  = new_data;

    /* link the old list off the new node */
    new_node->next = (*head_ref);

    /* move the head to pochar to the new node */
    (*head_ref)     = new_node;
}

// A utility function to print a given linked list
void printList(struct node *ptr)
{
    while (ptr != NULL)
    {
        printf("%c->", ptr->data);
        ptr = ptr->next;
    }
    printf("NULL\n");
}

/* Drier program to test above function*/
int main()
{
    /* Start with the empty list */
    struct node* head = NULL;
    char str[] = "abacaba";
    int i;

    for (i = 0; str[i] != '\0'; i++)
    {
        push(&head, str[i]);
        printList(head);
        isPalindrome(head)? printf("Is Palindrome\n\n"):
                            printf("Not Palindrome\n\n");
    }

    return 0;
}
```

Output:

```
a->NULL
```

```
Not Palindrome

b->a->NULL
Not Palindrome

a->b->a->NULL
Is Palindrome

c->a->b->a->NULL
Not Palindrome

a->c->a->b->a->NULL
Not Palindrome

b->a->c->a->b->a->NULL
Not Palindrome

a->b->a->c->a->b->a->NULL
Is Palindrome
```
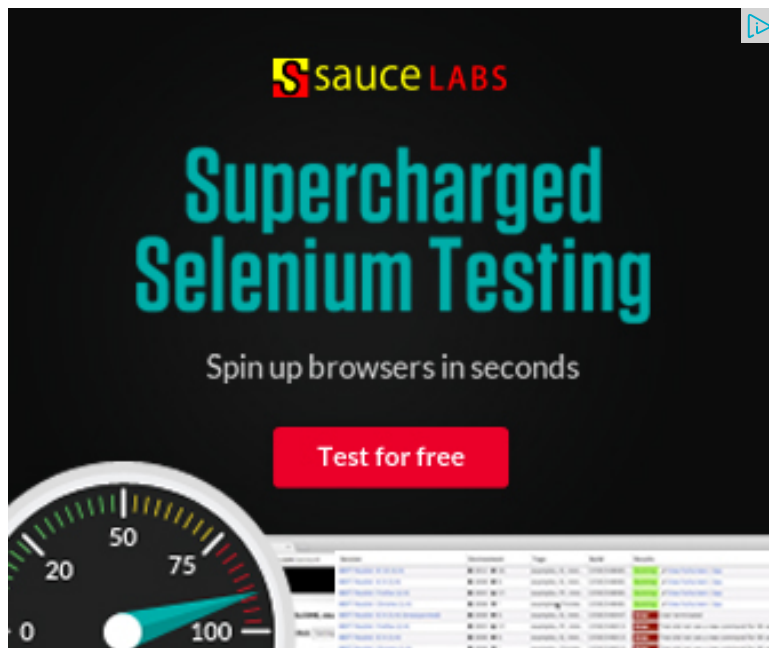

Time Complexity: O(n)
Auxiliary Space: O(n) if Function Call Stack size is considered, otherwise O(1).
